Personal Portfolio

SUMMARY

A software engineer with hands-on experience building production-grade AI systems, Retrieval Augmented Generation(RAG) platforms, agentic workflows, and cloud-native data solutions. Experienced in developing scalable applications that combine intelligent retrieval and LLM evaluation, while applying AI/ML techniques to build maintainable, high-performance systems.

SKILLS

Programming Languages: Python, JavaScript, SQL
Libraries: Pandas, Matplotlib, TensorFlow, PyTorch
Frameworks & Web: Node.js, Express.js, React.js, HTML, CSS
Databases: PostgreSQL, MongoDB, Neo4j
AI/ML: Machine Learning, Deep Learning, NLP, Generative AI (LLM - ChatGPT, Agents - Claude, Gemini, and GPT), LLM Evaluation, Agentic AI, LangChain, AutoGen, CrewAI, Prompt Engineering
Cloud & Distributed: Microsoft Azure, FastAPI, Docker, Data Pipelines
Testing: Unit Testing, Automation Testing (Playwright, Selenium)
Tools: Visual Studio, Git, Power BI, Excel, Power Point, Postman

PROFESSIONAL EXPERIENCE

Senior DS/ML Engineer, 07/2024 - Present
Turing
Worked on large-scale systems and services used by millions.
- Developed Python-based tools and services powering new ChatGPT features, including dataset preparation, performance testing, and integrating models into production workflows used at global scale. Contributed to major systems such as the SWE Bench model, Web Search feature in ChatGPT, and text-to-speech model with diverse voice accents.
- Tested and evaluated agents like Claude, Gemini, and GPT by running workflows through REST-based APIs such as Gmail, MySQL, Cursor, and Jira. Built Python scripts to connect APIs, manage databases, execute agent actions, validate outputs against expected results, and report performance gaps and improvements to engineering teams.
- Collaborated on AI evaluation and engineering initiatives involving multiple leading global technology platforms, gaining hands-on experience with large-scale LLM systems, agentic workflows, API integrations, and model quality assessment.

Data Science Intern, 01/2024 - 06/2024
Genpact
- Built and maintained distributed data pipelines on Azure using Python to process large volumes of business data, making it easier and more reliable for analytics teams to use.
- Used machine learning and Generative AI techniques on real client data to deliver insights and automate routine tasks, helping teams work faster and make better decisions.

PROJECTS

Developed a 3-Pipeline based Data Pipeline using LLM in GenAI
- Pipeline -1: We had a set of pdf documents in Italian. Loaded these documents to LLM with a certain prompt template, extracted the necessary contents in the documents using Azure service and converted them into English Language format, performed the required pre-processing steps, and stored the data in PostgreSQL.
- Pipeline-2: Built the necessary logic using the Pipeline-1 output to validate the Valid or Invalid Dispute, and achieved 92% accuracy in dispute validation.
- Pipeline-3: Automated the process using AI techniques to send emails to the customers who are having disputes with the billing document.

Built a Multi-agent System for Knowledge Graphs using Autogen and CrewAI frameworks - Generative AI
- Designed a Multi-Agent system utilizing Autogen and CrewAI Frameworks to automate the conversion of natural language queries into Cypher queries with 0 human intervention, enhancing interaction with Knowledge Graphs.
- Created the knowledge graph and stored in Neo4j graph database. Created five agents and established communication between them to get the desired results using Autogen and CrewAI frameworks. Trained the agents with LLM's through prompt engineering, facilitating continuous communication until the user obtains the desired outcome.

Implementation of RAG Pipeline for Retrieving Information from Documents using LangChain Framework - Generative AI
- Designed and implemented a RAG pipeline that reduced document search time by 70% by efficiently loading, splitting, storing, and indexing documents using DocumentLoaders, Text Splitters, VectorStore, and Embedding models for improved searchability and model performance.
- Enabled retrieval of relevant document parts based on user queries and used an LLM to generate accurate responses with 97% precision, highlighting advanced document handling and natural language processing skills.

Prediction of Chronic Kidney Disease using Different Machine Learning Models
- Developed and compared machine learning algorithms in predicting early detection of Chronic Kidney Disease (CKD) risks through analysis of medical data and achieved 92% accuracy rate.
- Utilized various ML models including decision trees, Naive Bayes, multi-layer perceptron, and support vector machines for better evaluation and compared their effectiveness in disease prediction.

EDUCATION

B. Tech, Artificial Intelligence 2020 – 2024
NIIT University Neemrana

ACHIEVEMENTS

- Awarded "**Top Trainer of the Month (Dec, 2024)**" and "**Rising Star of the Month (Apr, 2025)**" at Turing for high-quality delivery, strong ownership, and contributions to AI/ML project outcomes while consistently maintaining high throughput.
